

Early Journal Content on JSTOR, Free to Anyone in the World

This article is one of nearly 500,000 scholarly works digitized and made freely available to everyone in the world by JSTOR.

Known as the Early Journal Content, this set of works include research articles, news, letters, and other writings published in more than 200 of the oldest leading academic journals. The works date from the mid-seventeenth to the early twentieth centuries.

We encourage people to read and share the Early Journal Content openly and to tell others that this resource exists. People may post this content online or redistribute in any way for non-commercial purposes.

JSTOR is a digital library of academic journals, books, and primary source objects. JSTOR helps people discover, use, and build upon a wide range of content through a powerful research and teaching platform, and preserves this content for future generations. JSTOR is part of ITHAKA, a not-for-profit organization that also includes Ithaka S+R and Portico. For more information about JSTOR, please contact support@jstor.org.

*A Conjecture at the Quantity of Blood in Men,
together with an Estimate of the Celerity of its
Circulation. By Allen Moulin, M. D. Reg. S. S.*

IN a Sheep weighing alive 118*l.* we found but 5*l.* $\frac{1}{4}$ of Blood which is but $\frac{1}{77}$ of the weight of the Sheep. In a Lamb weighing 30*l.* $\frac{1}{2}$ when living, but there was but 1*l.* $\frac{1}{4}$ of Blood which is nearly a 20th part.

In a Duck weighing alive 2*l.* 14 Ounces 50 gr. we found an Ounce a half and 53 gr. of Blood, which is less than a 28th of the whole weight of the living Duck.

In a Rabbit weighing 10 Ounces, 7 Dr. and 50 gr. we found 2 Dr. 57 gr. of Blood, which is about a 30th Part.

In the right Ventricle and Auricle of the Heart of a Dog, I found 6 ounces of Blood, after that I injected into the jugular Vein a Liquor that coagulated the Blood. I found a greater quantity of Blood in the Heart of another Dog, whom I treated after the same manner. The Hearts were much distended by the Blood found in them. I shall therefore suppose, that 4 ounces only were received at a time by these Hearts without force, that is naturally: And least I should suppose a greater quantity of Blood to be admitted at a time than really is, I will suppose a Man's Heart, which is much larger, (and has much larger Vessels than those I speak of) to receive but 4 ounces at each *Diaftole*. Allowing 75 Pulses to every Minute, there will be 4500 in an hour, and 18000 ounces of Blood transmitted in that time. This last Number is the Product of the foregoing 4500, being multiplied by 4, the Number of Ounces at a *Diaftole*.

Now

Now if we shall suppose that a Man's Blood bears the same Proportion to his weight, as that of any of the aforesaid Animals had to its weight, which in a *Lamb* was the greatest, being $\frac{1}{24}$ part, it will follow that the quantity of circulating Blood in a Man weighing 160*l.* will not exceed 8*l.* or 128 ounces; according to which computation the Blood will circulate 140 times in an hour. But let us suppose that instead of 8*l.* the masse of Blood in such a Man be 12*l.* it will follow that it will circulate between 93 and 94 times in an hour; which is a circulation and half, and somewhat more, every minute. I take this last computation to be very modest, when especially it is considered that in the *Lamb* when opened, there was scarce a dram of Blood; in the *Sheep* not 3 oun. to be seen. From the celerity of the motion of the Blood now mentioned, we may give a good account of the sudden Refection with viuctuals, and particularly such as are liquid: we may also account for the quick passing of Urine, from the same thing; and also the quick motion of the *Chyle* into the Breasts of Nurses, without supposing unknown passages, from the Stomach or any other part into the Bladder and Breasts.

Half an ounce of Blood at a *Diastole* is the greatest quantity that I remember any Anatomist supposes to gett into the Heart, and they suppose the quantity of Blood in the Body to be between 15 and 25*l.* by which it will appear how their computations and mine differ.
